Dechesne C.A. Substracted library from atrophied and control soleus muscles Substraction was performed according to Diatchenko et al. (Diatchenko L. Lau YF, Campbell AP, Chenchik A, Mogadam F, Huang B, Lukyanov S, Lukyanov K, Gurskaya N, Sverdlov ED, Siebert PD. Subpression subtractive hybridization: a method for conspectation differentially regulated or tissue-specific CDNA probes and libraries. Proc Natl Acad Sci U S A. 1996, 33: 6025-30) Rats were female Sprague Dawley between 200 and 220g. Soleus muscle atrophy was performed by 14 days of hindlimb suspension."

Sequence 377 AA;

ğ

```
This sequence is human cyclin I. Antisense polynucleotides are useful for as probes and can be labelled and used for detection of neurones by hybridisation with mRNA for cyclin I (contained in the neurones and arising by the expression of the cyclin I gene in these cells). The gene can be used for detection of cancer cells by detecting the expression of the cyclin I gene in these cells. Also antibodies specific for the fragments of the protein (especially AAW21966) can be used for detection

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                g
                  tomognizes with cyclin-dependent kinese. ODE2, cyclin-dependent kinase 2 is used in the invention which relates to complexes of the CDK2 protein with other proteins, selected from cyclin 1, ERH, hsReq, hsReq*-1 and hsReq*-2 (AAY52185-Y52188). CDK2 is expressed late in G1 or early in C and hsReq*-2 (AAY52185-Y52188). CDK2 is expressed late in G1 or early in C compositions containing a CDK2 complex, an antibody targeting the complex, and nucleotide sequences encoding CDK2 or its derivatives can be used therapeutically. The complexes and their nucleotide sequences can be used to treat diseases or disorders associated with increased or decreased levels of the complex. Screening the complex, or a modulator of the complex for neoplastic activity by measuring the survival or proliferation of cells from a malignant cell line when in contact with the complex can be used to indicate if the the complex has anti-neoplastic activity. Screening for molecules that modulate the formation of the complexes can be used for treating or preventing attains a test animal, in which tumour growth or regression is measured to test whether anti-neoplastic activity is displayed. Diseases which can be treated or prevented by molecules which modulate the function of the complex include cancer, hyperproliferative disparders and atherosclerosis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  120

The present invention relates to diagnosing or monitoring transplant rejection, e.g. cardiac or kidney transplant rejection, in an individual comprises detecting the expression level of one or more genes. The methods, system and kits are useful in diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, exencial transplant rejection, mechanical organ replacement rejection, in an individual. The method is also useful in assessing the immune status of an individual. The methods are also useful in diagnosing and monitoring diseases that involve the immune system, e.g. rheumatoid arthritis, lupus, inflammatory bowel diseases, multiple sclerosis, HIV/AIDS or viral, baccerial or fungal infection. The present sequence represents a protein that is encoded by the mRNA of the invention.
                                                                                                                                                                                                                                                                                                                                                                     Diagnosing or monitoring transplant rejection, e.g. heart, kidney, liver, pancreas, pancreatic islet, lung, bone marrow or stem cell transplant rejection, in an individual, comprises detecting the expression level of

New CGDD polypeptides, useful for diagnosing, preventing, and treatin disorders associated with an abnormal expression or activity of CGDD, e.g. neuromuscular, immunological, cardiovascular disorders, cancer e.g. neuromuscular, and/or infections.

9

Claim 1; Page 250; 299pp; English.

The present invention relates to novel cell growth, differentiation and death (CGDD) proteins and polynucleotides encoding them. The sequences of the invention are useful in diagnosing, preventing and treating disorders associated with an abnormal expression or activity of CGDD such as sociated with an abnormal expression or activity of CGDD such as disease), muscular disorders (e.g. myotonic dystrophy, catatonia), endocrine disorders (e.g. diabetes, Grave's disease), cancers (e.g. disease), endocrine disorders (e.g. diabetes, Grave's disease), cancers (e.g. cleukaemia, cervical or breast cancers), immunological disorders (e.g. scleroderma, systemic lupus erythematosus, allergies), gastrointestinal slosorders (e.g. Crohn's disease), renal disorders (e.g. Goodpasture's syndrome), infections (e.g. viral, bacterial, fungal, parasitic, protozoal, helminthic), cardiovascular disorders (e.g. atherosclerosis) and hepatic diseases (e.g. cirrhosis). The polynucleotides can be used to create humanised animals or transgenic animals to model human diseases. CGDD-27 protein

The TAT polypeptides are overexpressed in cancer tissues compared to normal tissues, and may thus serve as effective targets for the diagnosis and treatment of cancer in

mammals. The invention also relates to nucleic acid and polypeptide sequences at least 80% identical to the TAT nucleic acids and polypeptides, axpression vectors and host cells comprising a TAT nucleic acid; an antibody specific for a TAT polypeptide; a peptide or organic molecule which binds to a TAT polypeptide; a peptide or organic antibodies, and methods and compositions for the treatment or diagnosis of cancer in mammals. TAT polypeptides, nucleic acids, antibodies, antagonists, binding molecules and compositions are useful for diagnosing or treating a cell proliferative disorder associated with increased TAT expression, particularly cancers such as breast cancer, colorectal cancer, lung cancer, cancer, lung cancer, cancer, lung cancer, cancer, lung cancer, cervical cancer, increased and leukaemia. TAT nucleic acids may further be nervous system, melanoma and leukaemia. TAT nucleic acids may further be cused as hybridisation probes, in chromosome and gene mapping, in chromosome identification and in gene therapy. The present sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       120

The present sequence is a polypeptide encoded by one of a large number of 5' ESTS derived from mRNAs encoding secreted proteins. The 5' ESTS were prepared from total human RNAs or polyA+ RNAs derived from 30 different tissues. EST sequences usually correspond mainly to the 3' untranslated region (UTR) of the mRNA because they are often obtained from oligo-dT primed cDNA libraries. Such ESTS are not well suited for isolating cDNA parameter from the 5' ends of mRNAs and even in those cases where longer cDNA sequences have been obtained, the full 5' UTR is rarely included. 5' ESTS are derived from mRNAs with intact 5' ends and can therefore be used to obtain full length cDNAs and genomic DNAs. 5' ESTS
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          are also used in diagnostic, forensic, gene therapy and chromosome mapping procedures. They are used to obtain upstream regulatory sequences and to design expression and secretion vectors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           130 MERIILDKLNWDLHTATPLDFLHIFHAIAVSTRPQLLFSLPKLSPSQHLAVLTKQLLHCM 189
                                                                                             Human, 5' EST; expressed sequence tag; secreted protein; cDNA isolation; gene therapy; chromosome mapping.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          61 ACNQLLQFRGSMLALAMVSLEMEKLIPDWLSLTIELLQKAQMDSSQLIHCRELVAHHLST

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       The invention comprises the amino acid and coding sequences of human proteins that are associated with cell growth, differentiation, and death (CGDD). The DNA and protein sequences of the invention are useful for diagnosing, treating or preventing disorders associated with aberrant expression of CGDD, such as: cell proliferative disorders (e.g. arteriosclerosis, atherosclerosis, bursitis, cirrhosis, hepatitis, polycythaemia vera, psoriasis and cancers), developmental disorders (e.g. cushing's syndrome and hypothyroidism), neurological disorders (e.g. cushing's stroke, Alzheimer's disease, plck's disease, Huntington's disease, Parkinson's disease and multiple sclerosis), autoimmune/inflammatory disorders (e.g. AIDS, allergies, anaemia, asthma, contact dermatitis and diabetes mellitus), and reproductive disorders (e.g. infertility, endometriosis and uterine fibroid). The present amino acid sequence represents a human CGDD-associated protein of the

                                                                                                                                                                                                                                                                   This peptide is a fragment of human cyclin I which can be specifically recognised by antibodies of the invention. The antibodies are used to detect the presence of cyclin I. Antisense cyclin I polymucleotides are useful for as probes and can be labelled and used for detection of neurones by hybridisation with mRNA for cyclin I (contained in the neurones and arising by the expression of the cyclin I gene in the cells). The gene can be used for detection of cancer cells by detecting
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Identifying peptides that are capable of binding to major histocompatibility complex (MIC) molecules of a particular haplotype by analyzing peptides bound to the soluble and secreted form of the MHC molecules of the particular haplotype.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Antirheumatic; antiallergic; antiarthritic; nootropic; neuroprotective;
                                                                                                                                                              Human cyclin I protein and related (anti:sense) DNA - used for neuron labelling method and cancer cell detection.
                                                                                                                                                                                                                                                                                                                                                                                                                the expression of the cyclin I gene in these cells

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Isolated nucleic acids and polypeptides, useful for preventing diagnosing and treating e.g. leukemia, inflammation and immune disorders.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The invention relates to human polymucleotides (AAI79941-AAI93841) and the encoded proteins (AA000010-AA013910) that exhibit activity elating to syrtokine, cell proliferentiation or which may induce production of other cytokines in other cell populations. The polymerleotides and polypeptides are useful in gene therapy, vaccines or peptide therapy. The polymedias have various cytokine-like activities, e.g. stem cell growth factor activity, hammatopoiesis regulating activity, tissue growth factor activity, immunomodulatory activity and activin/inhibin activity and may be useful in the diagnosis and/or treatment of cancer, leukaemia, nervous system disorders, arthritis and inflammation. originating from a particular cell type, which are capable of binding to major histocompatibility complex (MHC) molecules of a particular haplotype. The method comprises analysing peptides bound to the soluble and secreted form of the MHC molecules of the particular haplotype. The method is useful for identifying peptides for treating an autoimmune disease, such as T or B cell and/or alleragic disease, condition, rheumatoid arthritis, or multiple sclerosis, neurodegenerative disorders, equences of the invention may be used in a gene therapy application. The sequence represents a peptide relating to the method for identifying MHC binding peptides of the invention ö New immunogen useful as a vaccine for inducing cytotoxic T-lymphocyte, and for diagnosing, preventing or treating cancer e.g. ovarian carcinoma Human; immunogen; epitope; HIA-A1; human leukocyte antigen; CTL; cytotoxic Y lymphocyte; cytostatic; cancer; colorectal carcinoma; ovarian carcinoma; lung carcinoma; prostate carcinoma; vaccine; tumour; HLA-2; passive immunotherapy; cyclin. Gaps invention relates to a novel method for identifying peptides HLA-A2 associated immunogenic peptide from human Cyclin protein. ; 0 6; Length 10; 0; Indels 2.7%; Score 10; DB 6; 100.0%; Pred. The invention relates to an immunogen comprising an isolated polypeptide whose amino acid sequence comprises an epitopic peptide, does not include MAGEs 4 or MRG-ES proteins, or consists of Mage D protein or its immunologically active fragment. Also included are a polymucleotide encoding the immunogen or its complement, a vector comprising the polymucleotide, a mammalian cell comprising the vector and expressing the polymucleotide, a vaccine composition comprising the immunogen and antibody specific for the immunogen. The immunogen is useful for inducing a cytotoxic T lywphocyte (CTL) in vitro that is specific for a tumour cell expressing human leukocyte antigen (HLA)-Al or A2. The immunogen is useful for inducing a useful for inducing a mammalian cell that can express the immunogen, is useful for inducing a

cri response in vitro that is specific for a tumour cell expressing HLA-1 cubic immunogen or cell is useful for inducing CTL for treating a subject with cancer (carcinoma, preferably colorectal carcinoma, ovarian carcinoma, lung carcinoma, preferably colorectal carcinoma, ovarian carcinoma, lung carcinoma and prostate carcinoma). The immunogen is also useful for screening and diagnostic agents, for gene screening in a fallicted with cancer, for screening a sample for the presence of CTLs that specifically recognise the corresponding epitopes, as a diagnostic tool to evaluate the efficacy of the immunotherapeutic creatments which are utilised in MCD (major histocompatibility olass) tetramers which are utilised in conjunction with flow cytometry to quantitate the frequency of peptide-specific CTL that are present in a samples of lymphocytes from an individual, and for stimulating the sas and dor such as individual, and for stimulating the capents, and for use an reagents in other processes such as diagnostic reagents, and for use an seagents in other processes such as a finity chromatography. The present sequence is an immunogenic epitope

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The invention relates to a novel method for identifying peptides originating from a particular cell type, which are capable of binding to major histocompatibility complex (MHC) molecules of a particular haplotype. The method comprises analysing peptides bound to the soluble and secreted form of the MHC molecules of the particular haplotype. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              δ

The NBP46 root lectin is instrumental in recognising and binding to nitrogen fixing rhizobial bacteria via a lectin-carbohydrate interaction. The production of transgenic plants comprising an expression cassette expressing the NBP46 root lectin is advantageous since it would mean that non-leguminous plants could fix nitrogen from the atmosphere, lessening the need for the addition of nitrogen containing fertilizer to soil. This would lead to higher crop yields where soil has been overplanted and replenishment of the depleted soil with usable nitrogen. Alternatively, expression of NBP46 can be used to ombulate oligosaccharide signalling in the plant. The nucleic acid sequences can be used to inhibit expression of an endogenous gene and also to suppress endogenous NBP46 gene

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             à
                                                                                                                                                                                                                                                                                              ö
method is useful for identifying peptides for treating an autoimmune disease, such as T or B cell and/or allergic disease or condition, rheumatoid arthritis, or multiple sclerosis, neurodegenerative disorders, e.g. Alzheimer's disease, or diseases associated with inflammation. The aguences of the invention may be used in a gene therapy application. This sequence represents a peptide relating to the method for identifying MHC binding peptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  NBP46; lectin; Rhizobium; leguminous plant; transgenic plant; nitrogen; nitrogen; nitrogen;
                                                                                                                                                                                                                                                                                              Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        New polynucleotides encoding Nod factor binding lectins - useful for production of transgenic plants which are able to fix nitrogen.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                52. .73

```
introducing into a plant an expression cassette comprising a plant promoter operably linked to a heterologous LNP (lectin/nucleotide phosphohydrolase) polymucleotide, or its complement. The LNP's described in the invention are involved in binding a variety of carbohydrates, catalysing the dephosphorylation of nucleotide di- and tri-phosphates and are suspected to be involved in oligosaccharide signalling, important for the interaction of mycorrhizal fungi and plants. The method is useful to increase mycorrhizal infection (by increasing expression of the polynucleotide), resulting in increased uptake of nutrients by plants and better growth/development, but antisense (or other methods of) suppression of LNP expression is also contemplated. This is the amino acid sequence of the Dolichos biflorus lectin/nucleotide phosphohydrloase (LNP) that can be used to modulate mycorrhizal infection in plants

Sequence 1_Application US/09054492B

Patent No. (618115)

GENERAL INFORMATION:
APPLICANT: TAKESHI NAKAMURA

APPLICANT: TAKESHI NAKAMURA

TITLE OF INVENTION: HUMAN CYCLIN I AND GENES ENCODING SAME
NUMBER OF SEQUENCES: 5
CORRESPONDENCE ADDRESS:
ADDRESSEE: PILLSBURY, MADISON & SUTRO
STREET: 1100 NEW YORK AVENUE, N.W.
CITY: WASHINGTON
STATE: D.C.
COUNTRY: U.S.A.
ZIP: 20005
COMPUTER READABLE FORM:
MEDIUM TYPE: FLOPPY DISK
COMPUTER: IBM PC COMPATIBLE
OPERATING SYSTEM: DE-DOS/MS-DOS
SOFTWARE: PATENTIN RELEASE #1.0, VERSION #1.25
COMPUTER: 118M PC COMPATIBLE
OPERATING SYSTEM: DATA:
APPLICATION NUMBER: US/09/054,492B
FILING DATE: APRIL: 3, 1998
CLASSIFICATION NUMBER: 32,011
REFERENCE/DOCKET NUMBER: 7898/252159
TELECOMMUNICATION NUMBER: 32,011
REFERENCE/DOCKET NUMBER: 32,011
